Methodology

This analysis was conducted using a 7-stage computer vision pipeline:

1. Video Preprocessing

Frames extracted at 5 fps with CLAHE contrast enhancement in LAB color space.

2. Person Detection & Tracking

YOLOv8 object detection with BoT-SORT multi-object tracking for consistent student identification throughout the video.

3. Pose Estimation

YOLOv8-Pose model extracts 17 COCO body keypoints. Head orientation is computed using solvePnP with facial landmarks.

4. Spatial Analysis

Automatic seat assignment based on median positions during warm-up period. Neighbor graphs built using distance thresholds. Teachers identified by movement patterns and standing posture.

5. Behavioral Feature Extraction

Per-frame features include: head direction, mutual gaze detection, whispering posture, body lean, hand position relative to face and neighbors, paper sharing gestures.

6. Temporal Classification

Sliding window analysis (10-second windows, 2-second stride) with weighted scoring. Multi-criteria filter requires: minimum suspicious windows, confidence threshold, mutual behavior evidence, and absence of nearby teacher.

7. Alert Generation

Confidence tiers (Very High > 85%, High > 70%, Medium > 55%) with timestamped evidence and behavior summaries.

Important Notes:

- This system is designed to flag potential incidents for human review.
- False positives may occur due to normal classroom interactions.
- Results should be verified by reviewing the evidence frames and video.
- Teacher proximity during flagged periods may indicate supervised activity.
